

Abstract

This study evaluates pre-submission analysis for AI papers using multi-factor editorial criteria. We tested 85

1 Introduction

Editorial desk decisions are often driven by novelty and methodological rigor. We frame a system that predic

2 Methods

We collected 85 anonymized manuscripts from three labs. We extracted section-level features and citation i

3 Results

The system reached AUROC 0.82 versus 0.67 baseline. Citation ghost rate above 8 percent correlated with

4 Discussion

The approach appears useful for early triage but is constrained by sample size and domain skew. Future wo
